LEAD TECHNOLOGY CREATE BEAUTY

# A5 AI Intelligent skin tester

A5 AI Intelligent skin tester: With a research and development focus on solving skin problems, it integrates eight spectral imaging technologies and can professionally and objectively analyze seventeen problems of facial skin with flexible operations. The original intention of the research and development is to take photos and analyze reports with just one click, making it more convenient to operate.

## Three reporting modes-Comprehensive analysis report

- ----- Personal Information
- ----- 16-type skin classification and comprehensive score
- ----- On the left is the skin water content and on the right is a single report.
- ----- Shallow test
- ----- Deep test

Single indicators below C will be realised in the form of radar charts.

**Comparative analysis,  
only compare and  
analyse with the results  
of the last shooting.**

# Three reporting modes-Comprehensive analysis report

**Suggestions**

**Issue analysis**

Your current facial skin is often plagued by dryness and sensitivity which interact with each other and form a vicious cycle. When the skin is dry, a large amount of moisture is lost from the stratum corneum, causing tightly packed keratinocytes to loosen and impairing the skin's barrier function. External irritants can easily break through the defense line, triggering skin sensitivity symptoms. In a sensitive state, the skin will have inflammatory response, further damaging the skin barrier structure, leading to dysfunction of sebaceous glands and sweat glands. Reduced secretion of oil and water will aggravate the degree of skin dryness. As a result, dryness intensifies sensitivity, and sensitivity exacerbates dryness, significantly impacting the health and appearance of facial skin.

**Skincare advice**

1. Gentle Cleansing and Moisturizing: Use an amino acid-based facial cleanser to wash your face with lukewarm water. Follow immediately with a toner containing hyaluronic acid to hydrate, and use lotions or creams containing ceramide to retain moisture. Apply a hydrating mask 2 to 3 times a week.
2. Simplified Skincare and Thoughtful Product Selection: Avoid skincare products containing alcohol or fragrances. Prioritize products with simple ingredients and soothing and repairing effects, such as squalane or purslane extract, so as to reduce skin irritation.
3. Healthier Daily Habits: Drink plenty of water daily and eat fruits and vegetables rich in vitamins. Maintain a consistent sleep schedule, avoiding late nights. Minimize time in high-temperature environments and protect against wind when outdoors to lower risks of moisture loss and sensitivity.

PARAMETERS

# Parameters

Device Name	A5-AI intelligent skin tester
Model	ZMLH-A5
Pixel	36 million (Industrial-grade)
Spectrum	White light, Positive polarized light, Negative polarized light, Wood's light, UV light, Red pigment map, Brown map, and White map
Light shielding mode	mode: semi-open
Materials	ABS (Industrial grade)
Power supply	AC 100-260V, 50/60Hz
Dimension	433x637x520mm (folded: 433 × 424x520mm)
Central processing unit	Rockchip RK3568, quad-core Cortex-A55, with a maximum clock speed of 2.0GHz
Motherboard	R10-S6810, equipped with Android 11 system
Memory	Dual-channel LP DD R4, 4G
Hard drive	MMC 5.1, 32G

# Parameters

Device Name	A5-AI intelligent skin tester
Hard drive	MMC 5.1, 32G
Operation	Capacitive multi-touch touchscreen
Screen feature	90-degree foldable
WIFI	Built-in dual-band WIFI (2.4G, 5GB)
HDMI	1 Pcs
USB	2 Pcs
Screen ratio	16:9
Screen size	15.6 inch
Screen pixels	1920*1080
Device net weight	11.5 KG
Packing weight	17.8 KG
Packaging box size	600 x 580 x 640mm
Packaging material	corrugated paper + EPE
Other accessories	power cord

03

EIGHT  
SPECTRAL  
IMAGE  
ANALYSIS

## Eight spectral image analysis

White light

### THEORY

Visible spots and other blemishes on the skin surface (acne, spots, wrinkles, pores, etc.) under natural light sources, which are mainly used as the basis for other spectral image comparison.

Acne

Dark spots

Wrinkle

Pore

## Eight spectral image analysis

Positive polarized light

### THEORY

Positive polarized light can improve the clarity of superficial texture, magnify local details, so as to clearly observe the smoothness of skin, fine lines and wrinkles and bumps (wrinkles, pores, Acne scars, Acne, etc).

Wrinkle

Pore

Acne scars

Acne

## Eight spectral image analysis

Negative polarized light

### THEORY

Using negative polarized technology to filter out the refracted light on the skin surface, so that you can clearly examine the light brown, tan, dark brown, light yellow or dark red skin lesions; It can distinguish the condition of capillaries, facial acne, uniformity skin and other skin problems.

Dark spots

Pigment

Acne

## Eight spectral image analysis

Wood's light

### THEORY

Wood's light can detect deep pigments in dermis. The principle behind this is that melanin does not fluoresce after exposure to ultraviolet radiation, allowing melanin to stand out more clearly with stronger contrast.

Spots

Spots

Fluorescence

## Eight spectral image analysis

UV light

### THEORY

Under UV light source, the content and distribution of the purple pigment bilirubin are displayed clearly through fluorescence, which can be used for the auxiliary diagnosis and efficacy observation of pigmentary dermatoses, pore issues, skin infections, and porphyria.

## Eight spectral image analysis

Brown light

### THEORY

The position, area, shape, and severity of subcutaneous facial UV spots are processed by using RBX light source technology, which demonstrate skin damage from UV radiation and the accumulation of subcutaneous melanin.

## Eight spectral image analysis

Red light

### THEORY

Used to analyze subcutaneous hemoglobin and inflammatory pigment deposition on the face, such as sensitivity, skin lesions, acne, erythema, etc.

Acne

Blood  
streak

Mole

## Eight spectral image analysis

Mixed light

### THEORY

Skin texture roughness and collagen loss were revealed by polarizing analysis.

Rough  
texture

21

**DETECTION  
FUNCTION**

## 21 Detection function-Moisture Test Report 1

**Skin water content score**

The water content of the skin is sorted from high to low according to five levels and marked with color.

E

D

C

B

A

## 21 Detection function-Moisture Test Report 2

## 21 Detection function

### Sebum

#### Image Analysis

- The oil secretion of the skin surface can be checked under positive polarized light source.
- The algorithm displays areas of the skin with active oil secretion through yellow ,through the form of data, you can see the oiliness of facial skin more clearly and intuitively.
- Excess oil is one of the factors that trigger acne growth, so please take good oil control care if you have acne.

# 21 Detection function

## Pores

### Image Analysis

- Under negative polarized light source, it is possible to check if enlarged pores have formed on the skin surface.
- The algorithm uses the RBX technology to process and present the areas with large pores in the skin as dark gray small circles; it can also show the situation of already enlarged pores in the facial skin in a clearer and more intuitive data form.
- Pore clogging refers to the pores on the surface of the skin being blocked, which prevents sebum from being discharged normally, accompanied by the accumulation of stratum corneum and dirt. this phenomenon usually manifests itself in the form of blackheads, whiteheads or acne, and in severe cases may lead to skin problems such as acne and folliculitis.

# 21 Detection function

## Blackhead

### Image Analysis

- Under negative polarized light source, you can see blackheads formed by pores clogged by oil in the T-zone.
- The algorithm uses the RBX technology to process and present the area of blackheads in the T-zone as small dark gray circles; it enables a clearer and more intuitive view of the blackheads on the nose area through the data.
- Blackheads are formed by excess oil accumulation in the nose area of the skin and air oxidation. Areas with large pores are more likely to accumulate and store oil and dust in the air, so it is necessary to clean and moisturize in time to reduce the formation of large pores.

## 21 Detection function

### Superficial Pigment

#### Image Analysis

- Superficial pigment refers to pigmentation that has formed on the superficial layer of the skin, including: acne scars, spots, inflammatory pigmentation, etc.
- The coverage of pigmentation may exist in both deep and shallow layers. you can compare the image with the deep pigment image. If the shallow layer shows pigmentation but the deep layer shows no pigmentation, it means that the pigment is only deposited in the superficial layer of the skin.
- The algorithm marks the pigmented area with a purple polygon curve, and the shallow pigment can be seen more clearly and intuitively through the form of data.

## 21 Detection function

### Mixed Spot

#### Image Analysis

- Under negative polarized light, we can see the distribution of mixed spots on the skin surface. The algorithm identifies the facial complex spot area and marks it with a brown block.
- The mixed spot map shows skin pigmentation such as melasma, age spots, and freckles. Melasma is a darker patch on the skin that can appear brown, black, or dark brown. Melasma may expand over time, especially if daily sun protection and skin care are not taken care of. Some melasma may be slightly raised and feel slightly convex to the touch.
- The algorithm marks the mixed spot area with brown color blocks, and the mixed spot situation can be seen more clearly and intuitively through the form of data.

## 21 Detection function

### Acne

#### Image Analysis

- Look at the distribution of skin acne and superficial redness under negative polarized light.
- When pores are clogged with oil and dust, it is easy to fester or form inflammation, which will then turn into acne and acne.
- The algorithm identifies the distribution area of facial acne and marks it with blue circles. The more the number and the more obvious the redness of the skin, the more serious the skin acne problem is, and the skin needs to be oil-controlled to unclog the pores and eliminate inflammation. You can see the acne situation more clearly and intuitively through the form of data.

## 21 Detection function

### Skin Barrier

#### Image Analysis

- We can check the skin barrier health under negative polarized light source.
- The barrier image shows the skin redness problem and the distribution of red blood streaks. The formation of red blood streaks is mainly due to the damage of keratin, the weakness of the epidermis, and the long-term damage of the capillary position, which leads to vascular dilation and congestion.
- The redder the area, the more severe the damage to the skin barrier. This can be used as a reference for judging the sensitivity of the skin and the presence of inflammatory areas. The damaged condition of the barrier can be seen more clearly and intuitively in the form of data.

## 21 Detection function

### Wrinkle

#### Image Analysis

- The texture of the skin surface can be viewed under a positive polarized light source.
- The wrinkle image shows the roughness of the skin texture, such as large pores, dry lines, fine lines, and wrinkles. It can be used as a reference for judging the fineness of the skin and the loss of collagen.
- The algorithm identifies the patterns on the facial skin and marks the distribution of skin wrinkles in five areas (forehead wrinkles, nasal bridge wrinkles, eye area wrinkles, crow's feet wrinkles, and laugh lines) with Lake blue dotted lines. The more discontinuous the lines, the rougher the skin. This way, the wrinkles can be seen more clearly and intuitively in a data form.

## 21 Detection function

### Porphyrin

### Image Analysis

- The brick-red fluorescent spots in the picture are propionibacterium acnes and malassezia. these two bacteria will aggravate the occurrence of skin acne, so they can be used as a basis for judging skin acne.Through the form of data, the situation of porin can be seen more clearly and intuitively.
- The living environment of propionibacterium acnes and malassezia must have oil, so they can be used as a basis for judging the accumulation of oil in skin pores.

## 21 Detection function

### Deep Pigment

#### Image Analysis

- The bottom part of the figure shows wood's light. The yellow area represents the comprehensive color spot area identified by the algorithm and is marked with polygonal curves. This way, the situation of deep pigmentation can be seen more clearly and intuitively in the form of data.
- The dark (black, brown) block or dot skin that appears on the face is a display of skin pigmentation (such as melasma, freckles, malar spots, inflammatory pigmentation, acne marks, hemoglobin aggregation, etc.).
- The pigmentation in the deep layer of the skin can be compared with the sensitivity to determine whether it is an inflammatory hemoglobin accumulation or a spot problem.

## 21 Detection function

### Brown Pigment

### Image Analysis

- The depth of the overall brown color of the skin is mainly related to the skin color. People with darker skin or more hemoglobin have darker overall pigmentation.
- The areas with heavier pigmentation in the image are mostly those with higher pigment concentration density.
- Through the form of data, the brown pigment can be seen more clearly and intuitively.

## 21 Detection function

### Heat Map of Pigment

#### As shown in these images

- Heat map of pigment can check the distribution of pigment deep in the skin.
- The algorithm identifies the distribution of pigments on the face and presents it in the form of a heat map. Different colors are used to represent the distribution of spots, moles, and scars visible to the naked eye under negative polarized light. Red indicates severe skin pigmentation, yellow for medium, green for lighter skin, and blue for normal skin. The situation of pigmentation can be seen more clearly and intuitively through the form of data.
- Pigment production mechanism: the body's own regulation, physical or chemical factors stimulate melanocytes, so that their number increases and activity increases. The melanin produced cannot be completely removed with the stratum corneum and blood circulation, and finally deposits in the local skin.

## 21 Detection function

### Red Map of Sensitivity

#### As shown in these images

- In the Red Map of Sensitivity, we can observe the redness of the skin's surface layer and the distribution of red blood vessels.
- The picture clearly shows the distribution of red blood vessels, indicating that the skin is thin and sensitive, and requires proper protection and care.
- The shade of the background color in the red photo is related to the overall skin tone. Those with less hemoglobin will have a lighter color.
- The areas with a higher concentration of red color indicate a more concentrated accumulation of hemoglobin in the skin, which can be used as a reference for judging the sensitivity of the skin and the presence of inflammatory areas. The degree of skin sensitivity can be clearly and intuitively seen through the data form.

## 21 Detection function

### Heat Map of Sensitivity

#### As shown in these images

- The heat map of sensitivity represents skin sensitivity. When the skin shows significant redness and thinning of the stratum corneum, it becomes more susceptible to external stimuli and damage, leading to issues such as dryness, sensitivity, and redness.
- The heat map of sensitivity is based on the distribution of subcutaneous capillaries, with areas of greater sensitivity having more capillaries. Visible redness and acne on negative polarized light images indicate areas of severe sensitivity.
- The algorithm uses different colors to indicate varying degrees of sensitivity and their distribution on the skin. Areas with severe sensitivity are shown in deep red, including the lips; medium sensitivity is represented in yellow, mild sensitivity in green, and normal skin appears in blue. The sensitivity is more clearly and intuitively reflected in the form of data.

## 21 Detection function

### Fluorescent Agent

#### As shown in these images

- ☐ Fluorescent agent and pigments might both appear in facial imaging. To assess the fluorescent agent, focus specifically on the fluorescence response.
- ☐ The difference between fluorescent agent and porphyrins is as follows porphyrins exhibit brick-red fluorescent agent, while fluorescent agent display intense blue light and usually appear as large, sheet-like areas.
- ☐ The difference between fluorescent agent and facial .
- ☐ Dust is as follows facial dust appears as white, bright, floating, and short, wispy lines on the surface, while fluorescent agent typically display bright colors and are often more diffuse or spread over larger areas.

## 21 Detection function

### Collagen

As shown in these images

- Under the mixed light image, we can observe the loss of collagen on the skin surface.
- The mixed light image shows a situation where the skin texture is rough. For example: large pores on the skin, fine lines and wrinkles. It can be used as a reference for judging the skin's smoothness and the loss of collagen.
- The white dotted lines in the mixed light image indicate the loss of skin collagen and the rupture of elastic fibers. This way, the loss of collagen can be clearly and intuitively observed in a data form.
